Annotation: The article analyzes the cities of our country, the question of the priority of modernity or nationalism in their construction, features, alleged socio-philosophical problems that arise in this process, their solutions, and proposals are made. The works that can be performed in this area are also comparatively studied and conclusions are given.

Аннотация: В статье анализируются города нашей страны, вопрос приоритета современности или национализма в их строительстве, особенности, предполагаемые социально-философские проблемы, возникающие в этом процессе, их решения и вносятся предложения. Также сравнительно изучены работы, которые можно выполнить в данной области и даны выводы.

Key words: “Smart city”, industrialized cities, commercial cities, developments, clean heating, modern cities, program “Obod qishloq”, climo system.

Ключевые слова: “Умный город”, промышленно развитые города, коммерческие города, развития, экологически чистое теплоснабжение, современные города, программа “благополучное село”, система “климо”.

INTRODUCTION

The time has come when the development of cities determines the level of development of a country. Many countries in the world are busy building cities with various innovative solutions. It is said that Arab countries in particular have begun to build cities in various ways and the population living in them is arousing enthusiasm among many.

The coronavirus pandemic has changed the way of life in many cities in different countries. After the decrease in cars, governments began to use previously used spaces in a new way. There was a need for a safe distance between people. Traffic was banned on some streets, and the spaces vacated by cars were given to pedestrians for walking. People consciously began to try to create a safe and comfortable urban area. However, some governments still do not deny the need to build cities with a national spirit. Modernity has its way, but we should not forget about nationality. After all, in our opinion, with the loss of nationality from cities, the spirit of the nation also disappears. The way of thinking changes. Different thoughts in the mind pave the way for the loss of national characteristics.

LITERATURE REVIEW AND METHODS

In our country, scientific works devoted to the problems of urban planning and urban culture can be cited as an example of the candidate dissertations of our scientists A. Koziev and A. Mirzaakhmedov. The problems of improving the ecological situation in cities, predicting possible

risks, and studying the characteristics of their problems are highlighted in the work of our President Shavkat Mirziyoyev, We will continue our national development path with determination and take it to a new level [1; 255].

Methods such as analysis, synthesis, and comparison were used to cover the article.

RESULTS AND DISCUSSION

If we look at our history, our people have often lived in courtyard houses. They do not have sufficient experience in living in multi-storey buildings. The population in rural areas has mainly lived in large areas. Currently, for young people who are moving from villages to cities in search of a permanent source of income, the process of getting used to multi-storey buildings is not easy. The presence of various entertainment venues that are alien to our nationality, which are coming from abroad, will clearly affect their upbringing and lifestyle. Taking into account such factors, we believe that it will be good for our government to develop new programs such as the "Obod qishloq" program.

According to modern urban planning experts and ordinary people working in the field, modern cities should have the following features and amenities:

- in the evening, the parking lot should turn into a children's playground;
- the house and office should be in the same place;
- they should be built in places that create good conditions for people;
- strict digital control for citizens and fines for any violations;
- current digital control, cameras should be more and more rational;
- self-sufficient houses, cars should be rare;
- there should be the opportunity to swim freely in rivers;
- there should be many gardens in the city, everyone should have a small garden (they grow vegetables for themselves, just like in foreign movies).
- although the city is narrow, it should be spacious, that is, crowded [4; 2].
- the presence of cultural entertainment venues;
- the operation of institutions serving cultural recreation, etc.

In our opinion, the cities of Uzbekistan can have the above amenities in the future, but for this it is necessary to change the way of thinking and habits of the population. Before this, it is important to educate ecological ethics, public decency, and aesthetic taste.

At the same time, we have already noted above that it is of great importance to pay attention to nationality in the construction of cities.

In our opinion, it is of great importance for modern cities to have the following characteristics characteristic of our nationality.

- National museums;
- Crafts centers;
- National markets;
- Water sources;
- Monuments depicting national heroes;
- The presence of cool gardens;
- The presence of courtyard houses;

According to many scientists, ensuring the harmony of nationality and modernity is currently very effective. It, in turn, helps to preserve national identity and live a comfortable and prosperous life, while not falling behind the times.

Thinking about this, we will try to study foreign experience and, in addition, to harmonize nationalism with it.

One of the problems that need to be solved in the current cities of Uzbekistan is improving air quality. If we pay attention to foreign experience in this regard, we will see that there is a "Climo" system that measures and analyzes air quality by 12 parameters. This device is 100 times smaller and 10 times cheaper than a traditional air monitoring system. "Climo" allows us to effectively combat environmental pollution, which has become a serious problem in megacities [5; 1]. The presence of this system in Uzbekistan in the future is very necessary for our country, which is already recognized as the hottest spot in the world this year. It is no exaggeration to say that such a system is a system that cannot be postponed for all cities, especially for industrialized cities (Navoi, Zarafshan, Kuvasoy, Fergana, Kokand and Khakassia). At the same time, it is worth mentioning the national method of solving this problem. In our opinion, when building cities, it is necessary to build buildings in accordance with the direction of the wind. Because in this case, the urban area will allow air to circulate freely, as well as not to stagnate in the area for a long time. The fact that buildings in villages are often built in this way is explained by the older generation for the above reason.

We believe that the following factors will play an important role in the future of building cities that are imbued with the spirit of modernity and nationalism of our country:

- greening buildings in the cities of our country will save the city from overheating;
- green zones will be created in the public environment. In this way, the city will become comfortable for living. It will be possible to breathe freely even in hot weather.
- energy-efficient houses will not allow the greenhouse effect to increase.
- increase water sources;
- it is also necessary to plan the construction of fountains.
- new buildings will benefit from the intelligent and innovative use of wind. This will create interesting results in heat management.

These proposals are emerging as important factors necessary for the cities of our country.

The Meteodyn company, which is focused on climate science, has developed Urbawind software. It controls the movement of wind in the city. Thus, to maximize the use of wind, it is possible to use the location of the building, the size of the windows, and ensure air circulation in the residential building and cool it by several degrees [3; 1].

Paying attention to foreign experience, we see that white coating is used on roads in Los Angeles instead of traditional black asphalt. This method reduces the temperature of the ground in some places by 10°C. This, in turn, affects buildings. According to Erwan Cordeau, who is responsible for studying climate, air and energy at the Ile-de-France Institute, "The strong albedo due to solar radiation immediately goes to the sky, so the energy is not accumulated in the coating itself." This type of coating is also suitable for building roofs. You can paint the roof of a building white and reduce the temperature in the house by several degrees. Convenient, environmentally friendly heat control for everyone. In short, the use of innovations such as the above will be a solution to big problems for the cities of Uzbekistan in the future. But we must admit that we know very well that our ancestors whitewashed houses with lime and decorated them. If we compare the capabilities of this American solution and lime and use them based on the capabilities of our natural conditions, our cities would beautify themselves. In addition, we would be able to do productive work in other areas, excluding asphalt. At the same time, both economic benefits and environmental friendliness will be on our side. Now, if we combine the capabilities of these two tools, we will witness a wonderful innovation, in our opinion.

CONCLUSION

In conclusion, it is worth saying that the image of modern cities in Uzbekistan is currently being formed. We, the people, play an important role in its formation. Therefore, first of all, we need to change the worldview of people, master the culture of urbanization, and, in turn, face the world without forgetting the golden fund of our national culture and not lag behind progress. It is in our hands to have modernity or national priority in our cities. Or to build cities in a combination of both is also the responsibility of today's generation. The nature of cities also plays an important role in the path of the future generation. Therefore, finding the most alternative and correct solution is an urgent issue today.
