Abstract: this article, the environmental problems in our Republic and the reforms being carried out to eliminate them on large scale. Reasons for changing ecology from year to year. It is described how humanity affects the environment.

Key words: ecology , environmental pollution, industrial development harmful compounds in the atmosphere, waste, public health.

Enter.

Today's in the day ecology and environment protection to do and him improve current remains one of the problems.

Past of the century to the end come a person with nature between relationships balance As a result of its destruction, the environmental situation has changed dramatically.

Prevention of environmental pollution to protect and improve the ecology of our republic, of our country ancient situation to restore history by learning present in the circumstances should be used .From this 10 from next condition or a person to live style about imagination to do very difficult Earth sphere ecology past to the century relatively for example not seen way change or it also affects the disappearance of generations. In the world not only in Uzbekistan too population number growth, science technique progress, a person Due to the daily increase in demand, a number of environmental problems have arisen on earth. That's it therefore, today's in the day pure nature about thought conduct very difficult. Current at the time land on the surface forests increase instead of reduced is going

Nature various waste and gases with being polluted. From this except natural floods, forest fires, dust storms and other natural processes are occurring.

Ecological risk today's in the day more and more wide color take land on the face all countries that's it with at the same time, it forces Uzbekistan to study more deeply. In the world biodiversity decrease too let's see possible For example since 1970 since in the world wild an animal and birds the number 3000 type, big planetary infection by 52% air and terrestrial animal species reduced by 76%.

Ecological problems the world in the regions in particular Uzbekistan too current to the problem is turning Main part: Uzbekistan the world countries between ecological clean countries in the ranking initially in 2010 109th place, in 2019 while 102nd place, in 2020 97th place occupied if Uzbekistan in 2022 ecological level according to countries in the rating 180 ta times inside took only 107th place.

It will be reported on the website "The Environmental Performance Index".Uzbekistan at least 38.2 score collected this rating from the leader 2 equal to low In the last 10 years, the country scored only 1.9 points.

Main part.

in Uzbekistan main ecological problems the following:

- Climate change
- Atmosphere contamination
- Waste problem
- Water of resources decrease (freshwater)
- Desertification
- Loss of biodiversity
- Salinity
- Society in health problems

Ecological of factors day after day increase and nature in change a person of the factor effect is strong. The scope of human activity is developing so rapidly that there is not a single area of nature that is not within the reach of his conscious thinking and hands.

In fact, human society today has created such production enterprises that these forces using nature from the bosom millions tons ore, oil, coal like natural fossils can be moved from one place to another, processed and used in various sectors of the national economy.

This fossil riches again cannot be recovered reserve too so much not much .

These again work in the process into the atmosphere harmful gases release let's see possible

Discussion and results:

Currently Our republic big industry and Agrarian region in the future face held the development of the transport complex of mechanical engineering, energy, chemical, food industry is envisaged.

Such work issuer of forces development In the Republic social of ecosystems has a certain negative impact on the situation.

Industry from the centers coming out different different gases and waste around environment ecological causing the state to be disturbed.

of natural waters with industrial waste, pesticides and mineral fertilizers is also a problem is one. Atmosphere the air protection of doing main direction city and for this, compliance with sanitary and hygienic rules in populated areas

of our republic all in the regions waste reduce, less waste technologies should be created.

City zones green space program to the road to put the reason is from cars coming out absorbs harmful substances and supplies us with oxygen.

Work release to enterprises the air cleaning up filtered standing devices installation, possibility use of renewable minerals.

Waste problem too very wide comprehensive the problem being ecology pollution own has been showing its effect.

Some kind of waste long time during it rots this while to ecology and soil erosion has an effect. in our country get up kind of waste again working enterprises current achieve or in society using plastic bags instead of plastic bags.

Or person product buy will receive shops with partner activity take to go It is necessary. For example, let's say that he bought a product, if he brings his waste, he will return a certain percentage of it, which will also help to prevent the problem of waste.

Water of resources decrease.

Industry enterprises harmful gases release with one in line the water too a lot demand does. This and it causes the demand for water to increase.

From enterprises came out waters again work need. Waters two to the network separate needed : for household water and drinking water.

In the President's speech on July 12, 2017, at the meeting with the Chambers of the Oliy Majlis, politicians and the representatives of the environmental movement of Uzbekistan, the creation of new draft laws, improvement of the existing ones, strengthening of control and analysis activities at the level of today's demand, continuous ecological education concept work output, ecological culture issues of promotion, prevention of environmental pollution were also considered.

All environmental problems have an impact on public health. Loss of biodiversity reason is happening
Summary: Above of the said come get out so to the conclusion It can be concluded that protecting nature is the main duty of every person in society. We are dependent on nature, we cannot live without nature, so we must protect every inch of land, use natural resources wisely, use every drop of water sparingly.
