

PERSONAL DEVELOPMENT AND MODERN PEDAGOGICAL TECHNOLOGIES

Fayziyeva Zarina Rauf qizi

Annotation: The article discusses the issues of personal development in the context of the use of modern pedagogical technologies. The author analyzes the influence of the educational environment, digitalization and innovative teaching methods on the formation of a student's personality. Special attention is paid to the role of the teacher as a facilitator of personal growth, as well as the conditions that ensure the self-realization and self-development of students.

Keywords: personal development, pedagogical technologies, education, self-realization, digitalization.

Introduction

Modern education is undergoing significant changes under the influence of social, economic and technological factors. The main goal of the educational process is not only the transfer of knowledge, but also the formation of a personality capable of independent thinking, decision-making and responsibility for their actions. In this regard, the student's personal development is considered as a central element of pedagogical activity.

Modern pedagogical technologies are a set of teaching methods, forms and means that ensure the active participation of students in the educational process. They are aimed at unlocking the inner potential of a person and developing key competencies necessary for successful self-realization in society.

The main part

1. The concept and essence of personal development

Personal development is the process of formation of individual qualities, worldview and value orientations of a person. According to L. S. Vygotsky, personality is formed in the process of social interaction, where the educational environment plays a leading role. A. Maslow considered personal development as a person's movement towards self-actualization, i.e. the realization of their inner capabilities.

Modern pedagogy interprets personal development as a process that includes cognitive, emotional, and spiritual-moral components. It is important to emphasize that personal development is not limited to school or university education — it continues throughout a person's life and depends on their activity, motivation and desire for self-knowledge.

2. Modern pedagogical technologies as a means of personal development

The pedagogical technologies of the new generation are aimed at creating conditions for the active participation of students in the educational process. These include personality-oriented, project-based, research-based, interactive, and information and communication technologies (ICTs).

Personality-oriented technologies require respect for the individuality of each student, taking into account his interests and abilities. The teacher acts not only as a carrier of knowledge, but also as a mentor, facilitator, organizer of joint activities.

The use of ICT opens up new opportunities for personal development: it expands access to information, promotes the formation of digital literacy and develops independence. In the context of distance learning, it is especially important to maintain a balance between technical means and personal interaction between the teacher and the student.

Design and research technologies enable students to show initiative, critical thinking, and creativity. Working on a project builds students' responsibility, communication skills, and the ability to collaborate.

3. The role of the teacher in the process of personal development of students

The role of the teacher in modern education goes beyond traditional teaching. The teacher becomes the organizer of an educational environment where students can realize their abilities and interests. The teacher creates an atmosphere of trust, support and motivation, promotes the development of self-reflection and awareness of their own goals.

One of the key areas of a teacher's professional activity is the development of students' emotional intelligence, as it plays an important role in building harmonious interpersonal relationships and successful socialization.

In addition, the teacher must be ready for constant self-development, updating knowledge and adapting to new educational realities. Only a personally mature and professionally competent teacher is able to contribute to the formation of a student's personality.

Conclusion

Thus, personal development and modern pedagogical technologies are closely interrelated. The use of innovative approaches in teaching helps to unlock the individual capabilities of each student, develops critical thinking, responsibility and the ability to self-organize. The future of education is linked to the formation of a personality capable of creativity, collaboration and adaptation in a rapidly changing world.

The main task of modern pedagogy is to create conditions under which the student's personality will develop harmoniously, in accordance with his interests and potential.
